

Soft & Beautiful Skin - What Does And Doesn't Work To Keep Young Beautiful Natural Skin Glowing

Are you tired of trying to get your soft & beautiful skin back? Let's face it, the beautiful natural skin you had in your earlier years is gone. And now... you want to know what to use to get it back. Which ingredients don't work in skin care products and which ones are effective for keeping skin looking soft and beautiful?

We all want to turn the clock back. The years when your complexion was soft, firm and glowing has passed. Now it's turned dull and the fine lines and aging signs are starting to appear.

We've heard that skin care products containing collagen and CoQ10 are what's needed to achieve young looking skin. So, the hunt begins.

Two common ingredients found in products that don't work:

1. Collagen

Our bodies produce less collagen (and elastin) proteins as we age. The proteins responsible for keeping skin healthy, moisturized and young looking. If you know this, you may have already tried the face creams that advertise "collagen added" on the bottle.

Yes, we need more collagen, however, the collagen ingredient doesn't work. Collagen can't penetrate into the skin no matter how much cream you apply. The collagen doesn't penetrate or increase your collagen levels, because the collagen protein molecules are too large to be absorbed through your skin's pores.

2. CoQ10

Skin creams containing antioxidants are good for skin health. The first line of defense that the nutrients are able to defend are fighting those cell-damaging free radicals.

Free radicals are created internally and externally. Our bodies create free radicals through normal, necessary chemical reactions, as well as, externally from environmental pollutants, toxins, UV radiation, stress, and smoking.

A constant supply of antioxidants is crucial for our health, longevity and soft & beautiful skin. It makes sense then to defend our cells against free radicals, so we look for the popular CoQ10 ingredient. But why doesn't the normal CoQ10 work? Because, very few skin care products have adequate strengths of active CoQ10 that can effectively penetrate the skin.

However, there are effective ingredients that keep soft & beautiful skin glowing. The secret is found in effective natural ingredients.

Ingredients that do work:

Here's what you want in a face cream. A natural substance that's been clinically tested and proven to help your body stimulate more of its own collagen (and elastin) production. It also boosts the development of new skin cells, improves skin elasticity and moisture. And, the natural ingredient that's best is called CYNERGY TK from a small niche skin care company in New Zealand.

Because we're getting older, the amount of CoQ10 is reduced... meaning our cells lose their energy production and antioxidant power. And since we need both energy and powerful antioxidants in the form of CoQ10 for beautiful natural skin, another natural ingredient that's best at supplying CoQ10 is called NANO-LIPOBELLE H-EQ10.

You'll want Nano-Lipobelle H-EQ10 to fight the pollutants, toxins and UV rays because it's a special "nano-emulsion" form of CoQ10. The CoQ10 particles are broken down, to a minuscule size, allowing the CoQ10 to penetrate 7 layers deep to: nourish skin with antioxidants, counteract cell-damaging free radicals and protect against harmful UV rays.

Make no mistake about it, you can achieve soft & beautiful skin using skin care products which contain powerful, natural ingredients. The best creams contain Cynergy TK, Nano-Lipobelle H-EQ10 and other effective natural ingredients. When you use them, you will have beautiful natural skin, guaranteed.
